HISTORIANS HAVE OFTEN DEFINED the eighteenth century chronologically as spanning the years from 1715 to 1789. Politically, this makes sense since 1715 marks the end of the age of Louis XIV and 1789 was the year in which the French Revolution erupted. This period has often been portrayed as the final phase of Europe’s old order, before the violent upheaval and reordering of society associated with the French Revolution. Europe’s old order, still largely agrarian, dominated by kings and landed aristocrats, and grounded in privileges for nobles, clergy, towns, and provinces, seemed to continue a basic pattern that had prevailed in Europe since medieval times. But new ideas and new practices were also beginning to emerge. Just as a new intellectual order based on rationalism and secularism was emerging from the intellectual revolution of the Scientific Revolution and Enlightenment, demographic, economic, and social patterns were beginning to change in ways that represent the emergence of a modern new order.
For some, the ideas of the Enlightenment seemed to herald the possibility of a new political age as well. Catherine the Great, who ruled Russia from 1762 to 1796, wrote to Voltaire: “Since 1746 I have been under the greatest obligations to you. Before that period I read nothing but romances, but by chance your works fell into my hands, and ever since then I have never ceased to read them, and have no desire for books less well written than yours, or less instructive.” The empress of Russia also invited Diderot to Russia and, when he arrived, urged him to speak frankly “as man to man.” Diderot did, offering her advice for a far-ranging program of political and financial reform. But Catherine’s apparent eagerness to make enlightened reforms was tempered by skepticism. She said of Diderot: “If I had believed him everything would have been turned upside down in my kingdom; legislation, administration, finance—all would have been turned topsy-turvy to make room for impractical theories.” For Catherine, enlightened reform remained more a dream than a reality, and in the end, the waging of wars to gain more power was more important.

In the eighteenth century, the process of centralization that had characterized the growth of states since the Middle Ages continued as most European states enlarged their bureaucratic machinery and consolidated their governments in order to collect the revenues and build the armies they needed to compete militarily with the other European states. International competition continued to be the favorite pastime of eighteenth-century rulers. Within the European state system, the nations that would dominate Europe until World War I—Britain, France, Austria, Prussia, and Russia—emerged as the five great powers of Europe. Their rivalries led to major wars, which some have called the first “world wars” because they were fought outside as well as inside Europe. In the midst of this state building and war making, dramatic demographic, economic, and social changes heralded the emergence of a radical transformation in the way Europeans would raise food and produce goods.

◆ The European States

Most European states in the eighteenth century were ruled by monarchs. Few people questioned either the moral or practical superiority of hereditary monarchy as the best form of government, especially in the large and successful states. As Catherine II wrote in 1764: “The Russian Empire is so large that apart from the Autocratic Sovereign every other form of government is harmful to it, because all others are slower in their execution and contain a great multitude of various horrors, which lead to the disintegration of power and strength more than that of one Sovereign.”

Although the seventeenth-century justification for strong monarchy on the basis of divine right continued into the succeeding century, as the eighteenth century became increasingly secularized, divine-right assumptions were gradually superseded by influential utilitarian arguments. The Prussian king Frederick II expressed these well when he attempted to explain the services a monarch must provide for his people:

These services consisted in the maintenance of the laws; a strict execution of justice; an employment of his whole powers to prevent any corruption of manners; and defending the state against its enemies. It is the duty of this magistrate to pay attention to agriculture; it should be his care that provisions for the nation should be in abundance, and that commerce and industry should be encouraged. He is a perpetual sentinel, who must watch the acts and the conduct of the enemies of the state. . . . If he be the first general, the first minister of the realm, it is not that he should remain the shadow of authority, but that he should fulfill the duties of such titles. He is only the first servant of the state.2

This utilitarian argument was reinforced by the praises of the philosophes.

◆ Enlightened Absolutism?

There is no doubt that Enlightenment thought had some impact on the political development of European states in the eighteenth century. Closely related to the Enlightenment idea of natural laws was the belief in natural rights, which were thought to be inalienable privileges that ought not to be withheld from any person. These natural rights included equality before the law, freedom of religious worship, freedom of speech and press, and the right to assemble, hold property, and pursue happiness. The American Declaration of Independence summarized the Enlightenment concept of natural rights in its opening paragraph: “We hold these truths to be self-evident, that all men are created equal; that they are endowed by their creator with certain unalienable rights; that among these are life, liberty and the pursuit of happiness.”

But how were these natural rights to be established and preserved? In The Spirit of the Laws, Montesquieu had argued for constitutional guarantees achieved by a separation of powers. Rousseau had advocated a democratic society as the ideal path to maintain people’s natural rights. Most philosophes, however, did not trust the “people.” “It must please the animals,” Voltaire said, “when they see how foolishly men behave.” In the opinion of the philosophes, most people needed the direction provided by an enlightened ruler. What, however, made rulers enlightened? They must allow religious toleration, freedom of speech and press, and the right to hold private property. They must foster the arts, sciences, and education. Above all, they must not be arbitrary in their rule; they must obey the laws and enforce them fairly for all subjects. To
Voltaire, only strong monarchs seemed capable of overcoming vested interests and effecting the reforms society needed. Reforms then should come from above—from the rulers rather than from the people. Distrustful of the masses, the philosophers believed that absolute rulers, swayed by enlightened principles, were the best hope of reforming their societies.

The extent to which rulers actually did so is frequently discussed in political histories of the eighteenth century. Many historians once assumed that a new type of monarchy emerged in the later eighteenth century, which they called “enlightened despotism” or “enlightened absolutism.” Monarchs such as Frederick II of Prussia, Catherine the Great of Russia, and Joseph II of Austria supposedly followed the advice of the philosophers and ruled by enlightened principles, establishing a path to modern nationhood. Recent scholarship, however, has questioned the usefulness of the concept of “enlightened absolutism.” We can best determine the extent to which it can be applied by surveying the development of the European states in the eighteenth century and then making a judgment about the “enlightened absolutism” of the later eighteenth century.

**The Atlantic Seaboard States**

As a result of overseas voyages in the sixteenth century, the European economic axis began to shift from the Mediterranean to the Atlantic seaboard. In the seventeenth century, the English and Dutch expanded as Spain and Portugal declined. By the eighteenth century, Dutch power had waned, and it was left to the English and French to build the commercial empires that presaged the growth of a true global economy.

**FRANCE: THE LONG RULE OF LOUIS XV**

In the eighteenth century, France experienced an economic revival while the movement of the Enlightenment gained strength. The French monarchy, however, was not overly influenced by the philosophers and resisted reforms as the French aristocracy grew stronger.

Louis XIV had left France with enlarged territories but also an enormous debt, an unhappy populace, and a five-year-old great-grandson as his successor. The governing of France fell into the hands first of the regent, the duke of Orleans, whose good intentions were undermined by his drunken and immoral behavior, and later of Cardinal Fleury, the king’s minister. France pulled back from foreign adventures while commerce and trade expanded and the government promoted the growth of industry, especially in coal and textiles. The budget was even balanced for a while. When Fleury died in 1743, Louis XV (1715–1774) decided to rule alone. But Louis was both lazy and weak, and ministers and mistresses soon began to influence the king, control the affairs of state, and undermine the prestige of the monarchy. One mistress—probably the most famous of eighteenth-century Europe—was Madame de Pompadour. An intelligent and beautiful woman, she charmed Louis XV and gained both wealth and power, often making important government decisions and giving advice on appointments and foreign policy. The loss of an empire in the Seven Years’ War, accompanied by burdensome taxes, an ever-mounting public debt, more hungry people, and a court life at Versailles that remained frivolous and carefree, forced even Louis to realize the growing disgust with his monarchy. “Things will last my time at any rate,” he remarked myopically and prophetically.

Perhaps all might not have been in vain if Louis had been succeeded by a competent king. But the new king, Louis’s twenty-year-old grandson who became Louis XVI (1774–1792), knew little about the operations of the French government and lacked the energy to deal decisively with state affairs (see the box on p. 519). His wife, Marie Antoinette, was a spoiled Austrian princess who devoted much of her time to court intrigues. As France’s financial crises worsened, neither Louis nor his queen seemed able to fathom the depths of despair and discontent that soon led to violent revolution (see Chapter 19).

**GREAT BRITAIN: KING AND PARLIAMENT**

The success of the Glorious Revolution in England had prevented absolutism without clearly inaugurating constitutional monarchy. The eighteenth-century British political system was characterized by a sharing of power between king and Parliament, with Parliament gradually gaining the upper hand. (The United Kingdom of Great Britain came into existence in 1707 when the governments of England and Scotland were united; the term British came into use to refer to both English and Scots.) The king chose ministers responsible to himself who set policy and guided Parliament; Parliament had the power to make laws, levy taxes, pass the budget, and indirectly influence the king’s ministers. The eighteenth-century British Parliament was dominated by a landed aristocracy that historians usually divide into two groups: the peers, who sat in the House of Lords and served as lord lieutenants controlling the appointment of the justices of the peace; and the landed gentry, who sat in the House of Commons and served as justices of the peace in the counties. There is much historical debate over whether it makes sense to distinguish between the aristocracies because the two groups had much in common. Both were landowners with similar economic interests, and they frequently intermarried.

Although the British monarchy was faced with a powerful aristocracy that monopolized Parliament and held most of the important governing posts locally (as justices of the peace in the counties) and nationally, it still exercised considerable power. Because the aristocracy was divided by factional struggles based on family rivalries, the kings could take advantage of the divisions to win aristocratic supporters through patronage, awarding them titles, government posts, and positions in the church and household staff.
The French King's Bedtime

Louis XIV had used court etiquette to magnify the dignity of kingship. During the reign of Louis XVI (1774–1792), however, court etiquette degenerated to ludicrous depths. This excerpt from the Memoirs of the Comtesse de Boigne describes the king’s coucher, the formal ceremony in which the king retired for the night.

Comtesse de Boigne, Memoirs

The king [Louis XVI] went to his coucher. The so-called coucher took place every evening at half past nine. The gentlemen of the court assembled in the bedroom of Louis XVI (but Louis XVI did not sleep there). I believe that all those who had been presented at court were permitted to attend.

The king came in from an adjoining room, followed by his domestic staff. His hair was in curlers, and he was not wearing his decorations. Without paying attention to anybody, he stepped behind the handrail surrounding the bed, and the chaplain on duty was given the prayer book and a tall taperstand with two candles by one of the valets. He then joined the king behind the handrail, handed him the book, and held the taperstand during the king’s prayer, which was short. The king then went to the part of the room where the courtiers were, and the chaplain gave the taperstand back to the first valet who, in turn, took it over to a person indicated by the king. This person held it as long as the coucher lasted. This distinction was very much sought after. . . .

The king had his coat, vest and finally shirt removed. He was naked to the waist, scratching and rubbing himself as if alone, though he was in the presence of the whole court and often a number of distinguished foreigners.

The first valet handed the nightshirt to the most qualified person. . . . If it was a person with whom the king was on familiar terms, he often played little tricks before donning it, missed it, passed it, and ran away, accompanying this charming nonsense with hearty laughter, making those who were sincerely attached to him suffer. Having donned the nightshirt, he put on his robe and three valets unfastened the belt and the knee buckles of his trousers, which fell down to his feet. Thus attired, hardly able to walk so absurdly encumbered, he began to make the round of the circle.

The duration of this reception was by no means fixed; sometimes it lasted only a few minutes, sometimes almost an hour; it depended on who was there. . . . When the king had enough, he dragged himself backward to an easy chair which had been pushed to the middle of the room and fell heavily into it, raising both legs. Two pages on their knees seized his shoes, took them off, and dropped them on the floor with a thump, which was part of the etiquette. When he heard it, the doorman opened the door and said, “This way, gentlemen.” Everybody left, and the ceremony was over. However, the person who held the taperstand was permitted to stay if he had anything special to say to the king. This explains the high price attached to this strange favor.

What enabled the British system of political patronage to work was the structure of parliamentary elections. The deputies to the House of Commons were chosen from the boroughs and counties but not by popular vote and hardly in any equitable fashion. Of the almost 500 deputies in the House of Commons, about 400 were chosen from the boroughs. Past history rather than population determined the number of delegates from each borough, however, so in one borough six people might choose two representatives whereas new cities like Manchester had no delegates at all despite their growing populations. Who could vote also varied wildly, enabling wealthy landed aristocrats to gain support by patronage and bribery; the result was a number of “pocket boroughs” controlled by a single person (hence “in his pocket”). The duke of Newcastle, for example, controlled the representatives from seven boroughs. It has been estimated that out of 405 borough deputies, 293 were chosen by fewer than 500 voters. This aristocratic control also extended to the county delegates, two from each of England’s forty counties. Although all holders of property worth at least forty shillings a year could vote, members of the leading landed gentry families were elected over and over again. Parliament then was an institution largely dominated by the landed aristocracy, but their factional struggles enabled the monarchy still to exercise some power by its control of patronage.

Since the ministers were responsible for exercising the king’s patronage, who became his chief ministers took on great political significance. In 1714, a new dynasty—the Hanoverians—was established when the last Stuart ruler, Queen Anne (1702–1714), died without an heir. The crown was offered to the Protestant rulers of the German state of Hanover. Both George I (1714–1727) and George II (1727–1760) relied on Robert Walpole as their chief or prime minister and the duke of Newcastle as their main dispenser of patronage, putting the latter at the center of British politics. Since the first Hanoverian king did not speak English and neither the first nor the second George had much familiarity with the British system, the chief ministers were allowed to handle Parliament and dispense patronage. Many historians feel that this exercise of ministerial power was an important step in the development of the modern cabinet system in British government.
Robert Walpole served as prime minister from 1721 to 1742 and pursued a peaceful foreign policy to avoid new land taxes. But new forces were emerging in eighteenth-century Britain as growing trade and industry led an ever-increasing middle class to favor expansion of trade and world empire. The exponents of empire found a spokesman in William Pitt the Elder, who became prime minister in 1757 and furthered imperial ambitions by acquiring Canada and India in the Seven Years’ War (see The Seven Years’ War later in this chapter).

Despite his successes, however, Pitt the Elder was dismissed by the new king George III (1760–1820) in 1761 and replaced by the king’s favorite, Lord Bute. Although characterized as a rather stupid person, George III was not the tyrant he is often portrayed as being. Determined to strengthen monarchical authority, his desire to wield the power of patronage personally led to the ouster of Pitt. At the same time, however, as a growing number of newspapers spread Enlightenment ideas to an expanding reading public, the clamor for the reform of both patronage and the electoral system began to increase. The saga of John Wilkes soon intensified the public outcry.

An ambitious middle-class member of the House of Commons, John Wilkes was an outspoken journalist who publicly criticized the king’s ministers. Arrested and soon released, Wilkes was expelled from his seat in Parliament. When he persevered and won another parliamentary seat from the county of Middlesex near London, he was again denied the right to take his place in Parliament. The cause of John Wilkes quickly became identified with liberty, and the slogan “Wilkes and Liberty” was frequently used by his supporters who came from two major social groups: the common people of London, who had no voting rights, and a middle element of voting freeholders, such as guild masters and small merchants in London and the surrounding counties. The cry for liberty soon spilled over into calls for the reform of Parliament and an end to parliamentary privileges. In 1780, the House of Commons affirmed that “the influence of the crown has increased, is increasing, and ought to be diminished.” At the same time, criticism at home was exacerbated by criticism abroad, especially by the American colonists whose discontent with the British system had led to rebellion and separation (see Chapter 19). Although minor reforms of the patronage system were made in 1782, King George III managed to avoid more drastic change by appointing William Pitt the Younger (1759–1806), son of William Pitt the Elder, as prime minister in 1783. Supported by the merchants,
industrial classes, and the king, who used patronage to gain support for Pitt in the House of Commons, the latter managed to stay in power through the French revolutionary and Napoleonic eras. George III, however, remained an uncertain supporter because of periodic bouts of insanity (he once thought a tree in Windsor Park was the king of Prussia). With Pitt's successes, serious reform of the corrupt parliamentary system was avoided for another generation.

THE DECLINE OF THE DUTCH REPUBLIC

After its century in the sun, the Dutch Republic or United Netherlands suffered a decline in economic prosperity. Both local and national political affairs were dominated by the oligarchies that governed the Dutch Republic's towns. In the eighteenth century, the struggle continued between these oligarchs (or regents as they were called from their governing positions) and the house of Orange, who as stadholders headed the executive branch of government. The regents sought to reduce the power of the Orangists but soon became divided when Dutch burghers who called themselves the Patriots (artisans, merchants, shopkeepers) began to agitate for democratic reforms that would open up the municipal councils to greater participation than that of the oligarchs. The success of the Patriots, however, led to foreign interference when the Prussian king sent troops to protect his sister, wife of the Orangist stadholder. The Patriots were crushed, and both Orangists and regents reestablished the old system. The intervention by Prussia serves to remind us of the growing power of the central European states.

Absolutism in Central and Eastern Europe

Of the five major European states, three were located in central and eastern Europe and came to play an increasingly important role in European international politics.

PRUSSIA: THE ARMY AND THE BUREAUCRACY

Two able Prussian kings in the eighteenth century, Frederick William I and Frederick II, further developed the two major institutions—the army and the bureaucracy—that were the backbone of Prussia. Frederick William I (1713–1740) promoted the evolution of Prussia's highly efficient civil bureaucracy by establishing the General Directory. It served as the chief administrative agent of the central government, supervising military, police, economic, and financial affairs. Because Prussia's disjointed territories could hardly have been preserved without a centralized administrative machine, Frederick William strove to maintain a highly efficient bureaucracy of civil service workers. It became a special kind of organization with its own code in which the supreme values were obedience,
CHAPTER 18

honor, and service to the king as the highest duty. As Frederick William asserted: "One must serve the king with life and limb, with goods and chattels, with honor and conscience, and surrender everything except salvation. The latter is reserved for God. But everything else must be mine." For his part, Frederick William personally kept a close watch over his officials to ensure that they performed their duties. As the Saxon minister at Berlin related:

Every day His Majesty gives new proofs of his justice. Walking recently at Potsdam at six in the morning, he saw a post-coach arrive with several passengers who knocked for a long time at the post-house which was still closed. The King, seeing that no one opened the door, joined them in knocking and even knocked in some window-panes. The master of the post then opened the door and scolded the travelers, for no one recognized the King. But His Majesty let himself be known by giving the official some good blows of his cane and drove him from his house and his job after apologizing to the travelers for his laziness. Examples of this sort, of which I could relate several others, make everybody alert and exact.

Close, personal supervision of the bureaucracy became a hallmark of the eighteenth-century Prussian rulers.

Under Frederick William I, the rigid class stratification that had emerged in seventeenth-century Brandenburg-Prussia persisted. The nobility or landed aristocracy known as Junkers, who owned large estates with many serfs, still played a dominating role in the Prussian state. The Junkers held a complete monopoly over the officer corps of the Prussian army, which Frederick William passionately continued to expand. By the end of his reign, the army had grown from 45,000 to 83,000 men. Though tenth in physical size and thirteenth in population among the European states, Prussia had the fourth largest army after France, Russia, and Austria.

While nobles served as officers, rank-and-file soldiers were usually peasants who served a long number of years. Discipline in the army was extremely rigid and even cruel—so cruel, in fact, that desertion was common. The king advised his generals not to take troops through a forest on maneuvers because it offered too many opportunities for running away. By using nobles as officers, Frederick William ensured a close bond between the nobility and the army and, in turn, the loyalty of the nobility to the absolute monarch.

As officers, the Junker nobility became imbued with a sense of service to the king or state. All the virtues of the Prussian nobility were, in effect, military virtues: duty, obedience, sacrifice. At the same time, because of its size and reputation as one of the best armies in Europe, the Prussian army was the most important institution in the state. "Prussian militarism" became synonymous with the extreme exaltation of military virtues. Indeed, one Prussian minister remarked around 1800 that "Prussia was not a country with an army, but an army with a country which served as headquarters and food magazine."

The remaining classes in Prussia were considerably less important than the nobility. The peasants were born
on their lords’ estates and spent most of the rest of their lives there or in the army. They had few real rights and even needed their Junker’s permission to marry. For the middle class, the only opportunity for any social prestige was in the Prussian civil service where the ideal of loyal service to the state became a hallmark of the middle-class official. Frederick William allowed and even encouraged men of nonnoble birth to serve in important administrative posts. When he died in 1740, only three of his eighteen privy councillors were of noble birth.

Frederick the Great (1740–1786) was one of the best educated and most cultured monarchs in the eighteenth century. He was well versed in Enlightenment thought and even invited Voltaire to live at his court for several years. His intellectual interests were despised by his father who forced his intelligent son to prepare for a career in ruling (see the box above). A believer in the king as the “first servant of the state,” Frederick the Great became a conscientious ruler who made few innovations in the administration of the state. His diligence in overseeing its operation, however, made the Prussian bureaucracy well known for both its efficiency and its honesty.

For a time, Frederick seemed quite willing to follow the philosophes’ recommendations for reform. He established a single code of laws for his territories that eliminated the use of torture except in treason and murder cases. He also granted a limited freedom of speech and press as well as complete religious toleration, no difficulty since he had no strong religious convictions anyway. Although Frederick was well aware of the philosophes’ condemnation of serfdom, he was too dependent on the Prussian nobility to interfere with it or with the hierarchical structure of Prussian society. In fact, Frederick II was a social conservative who made Prussian society even more aristocratic than it had been before. Frederick reversed his father’s policy of allowing commoners to rise to power in the civil service and reserved the higher positions in the bureaucracy for members of the nobility. The upper ranks of the bureaucracy came close to constituting a hereditary caste over time.

Like his predecessors, Frederick the Great took a great interest in military affairs and enlarged the Prussian army (to 200,000 men). Unlike his predecessors, he had no objection to using it. Frederick did not hesitate to take advantage of a succession crisis in the Habsburg monarchy to seize the Austrian province of Silesia for Prussia. This act aroused Austria’s bitter hostility and embroiled Frederick in two major wars, the War of the Austrian

Frederick the Great and His Father

As a young man, the future Frederick the Great was quite different from his strict and austere father, Frederick William I. Possessing a high regard for French culture, poetry, and flute playing, Frederick resisted his father’s wishes that he immerse himself in governmental and military affairs. Eventually, Frederick capitulated to his father’s will and accepted the need to master affairs of state. These letters, written when Frederick was sixteen, illustrate the difficulties in their relationship.

Frederick to His Father, Frederick William I

(September 11, 1728)

I have not ventured for a long time to present myself before my dear papa, partly because I was advised against it, but chiefly because I anticipated an even worse reception than usual and feared to vex my dear papa still further by the favor I have now to ask; so I have preferred to put it in writing.

I beg my dear papa that he will be kindly disposed toward me. I do assure him that after long examination of my conscience I do not find the slightest thing with which to reproach myself; but if, against my wish and will, I have vexed my dear papa, I hereby beg most humbly for forgiveness, and hope that my dear papa will give over the fearful hate which has appeared so plainly in his whole behavior and to which I cannot accustom myself. I have always thought hitherto that I had a kind father, but now I see the contrary. However, I will take courage and hope that my dear papa will think this all over and take me again into his favor. Meantime I assure him that I will never, my life long, willingly fail him, and in spite of his disfavor I am still, with most dutiful and childlike respect, my dear papa’s

Most obedient and faithful servant and son,

Frederick

Frederick William to His Son Frederick

A bad, obstinate boy, who does not love his father; for when one does one’s best, and especially when one loves one’s father, one does what he wishes not only when he is standing by but when he is not there to see. Moreover you know very well that I cannot stand an effeminate fellow who has no manly tastes, who cannot ride or shoot (to his shame be it said!), is untidy about his person, and wears his hair curled like a fool instead of cutting it; and that I have condemned all these things a thousand times, and yet there is no sign of improvement. For the rest, haughty, offish as a country lout, conversing with none but a favored few instead of being affable and popular, grimacing like a fool, and never following my wishes out of love for me but only when forced into it, caring for nothing but to have his own way, and thinking nothing else is of any importance. This is my answer.

Frederick William
Succession and the Seven Years’ War (see Wars and Diplomacy later in this chapter). Although the latter war left his country exhausted, Frederick succeeded in keeping Silesia. After the wars, the first partition of Poland with Austria and Russia in 1772 gave him the Polish territory between Prussia and Brandenburg and created greater unity for the scattered lands of Prussia. By the end of his reign, Prussia was recognized as a great European power.

THE AUSTRIAN EMPIRE OF THE HABSBURGS

The Austrian Empire had become one of the great European states by the beginning of the eighteenth century. The city of Vienna, center of the Habsburg monarchy, was filled with magnificent palaces and churches built in the Baroque style and became the music capital of Europe. And yet Austria, by its very nature as a sprawling empire composed of many different nationalities, languages, religions, and cultures, found it difficult to provide common laws and a centralized administration for its people.

Empress Maria Theresa (1740–1780), however, stunned by the loss of Austrian Silesia to Prussia in the War of the Austrian Succession, resolved to reform her empire in preparation for the seemingly inevitable next conflict with rival Prussia. Although Maria Theresa was forced to accept the privileges of the Hungarian nobility and the right of her Hungarian subjects to have their own laws, she did abolish the Austrian and Bohemian chancelleries and replaced them with departments of foreign affairs, justice, war, commerce, and internal affairs that functioned for both territories. Maria Theresa also curtailed the role of the diets or provincial assemblies in taxation and local administration. Now clergy and nobles were forced to pay property and income taxes to royal officials rather than the diets. The Austrian and Bohemian lands were divided into ten provinces and subdivided into districts, all administered by royal officials rather than representatives of the diets, making part of the Austrian Empire more centralized and more bureaucratic. But these administrative reforms were done for practical reasons—to strengthen the power of the Habsburg state—and were accompanied by an enlargement and modernization of the armed forces. Maria Theresa remained staunchly Catholic and conservative and was not open to the wider reform calls of the philosophes. But her successor was.

From 1765 to 1780, Maria Theresa had allowed her son Joseph II to share rule with her, although Joseph felt restrained by his mother’s lack of interest in the reform ideas of the Enlightenment that greatly appealed to him. When he achieved sole power in 1780, he was determined to make changes; at the same time, he carried on his mother’s chief goal of enhancing Habsburg power within the monarchy and Europe. Joseph II was an earnest man who believed in the need to sweep away anything standing in the path of reason. As Joseph expressed it: “I have made Philosophy the lawmaker of my empire, her logical applications are going to transform Austria.”

Joseph’s reform program was far-reaching. He abolished serfdom and tried to give the peasants hereditary rights to their holdings. An exponent of Physiocratic ideas (see Chapter 17), he abandoned economic restraints by eliminating internal trade barriers, ending monopolies, and removing guild restrictions. A new penal code was instituted that abrogated the death penalty and established the principle of equality of all before the law. Joseph introduced drastic religious reforms as well, including complete religious toleration and restrictions on the Catholic church. Altogether, Joseph II issued 6,000 decrees and 11,000 laws in his effort to transform Austria.

Joseph’s reform program proved overwhelming for Austria, however. He alienated the nobility by freeing the

The Proposals of Catherine II for a New Law Code

Catherine II the Great of Russia appeared for a while to be an enlightened ruler. In 1767, she convened a legislative commission to prepare a new code of laws for Russia. In her famous Instruction, she gave the delegates a detailed guide to the principles they should follow. Although the guidelines were obviously culled from the liberal ideas of the philosophes, the commission itself accomplished nothing, and Catherine's Instruction was soon forgotten.

RUSSIA UNDER CATHERINE THE GREAT

Peter the Great was followed by a series of six successors who were made and unmade by the palace guard. The last of these six was Peter III, whose German wife Catherine learned Russian and won the favor of the palace guard. Peter was murdered by a faction of nobles, and Catherine II the Great (1762–1796) emerged as autocrat of all the Russias.

Catherine was an intelligent woman who was familiar with the works of the philosophes. Voltaire and Diderot were among her correspondents, although some historians believe she corresponded with philosophes simply to improve her image abroad. Catherine claimed that she wished to reform Russia along the lines of Enlightenment ideas, but she was always shrewd enough to realize that her success depended upon the support of the palace guard and the gentry class from which it stemmed. She could not afford to alienate the Russian nobility.

Initially, Catherine seemed eager to pursue reform. She called for the election of an assembly in 1767 to debate the details of a new law code. In her Instruction, written as a guide to the deliberations, Catherine questioned the institution of serfdom, torture, and capital punishment and even advocated the principle of the equality of all people in the eyes of the law. But one and one-half years of negotiation produced little real change.

In fact, Catherine’s subsequent policies had the effect of strengthening the landholding class at the expense of all others, especially the Russian serfs. In order to reorganize local government, Catherine divided Russia into fifty provinces, each of which in turn was subdivided into districts whose ruling officials were chosen by the nobles. In this way, the local nobility became responsible for the day-to-day governing of Russia. Moreover, the

serfs and alienated the church by his attacks on the monastic establishment. Even the serfs were unhappy, unable to comprehend the drastic changes inherent in Joseph’s policies. His attempt to rationalize the administration of the empire by imposing German as the official bureaucratic language alienated the non-German nationalities. As Joseph complained, there were not enough people for the kind of bureaucracy he needed. His deep sense of failure is revealed in the epitaph he wrote for his gravestone: “Here lies Joseph II who was unfortunate in everything that he undertook.” His successors undid many of his reform efforts.

RUSSIA UNDER CATHERINE THE GREAT

Peter the Great was followed by a series of six successors who were made and unmade by the palace guard. The last of these six was Peter III, whose German wife Catherine learned Russian and won the favor of the palace guard. Peter was murdered by a faction of nobles, and Catherine II the Great (1762–1796) emerged as autocrat of all the Russias.

Catherine was an intelligent woman who was familiar with the works of the philosophes. Voltaire and Diderot were among her correspondents, although some historians believe she corresponded with philosophes simply to improve her image abroad. Catherine claimed that she wished to reform Russia along the lines of Enlightenment ideas, but she was always shrewd enough to realize that her success depended upon the support of the palace guard and the gentry class from which it stemmed. She could not afford to alienate the Russian nobility.

Initially, Catherine seemed eager to pursue reform. She called for the election of an assembly in 1767 to debate the details of a new law code. In her Instruction, written as a guide to the deliberations, Catherine questioned the institution of serfdom, torture, and capital punishment and even advocated the principle of the equality of all people in the eyes of the law. But one and one-half years of negotiation produced little real change.

In fact, Catherine’s subsequent policies had the effect of strengthening the landholding class at the expense of all others, especially the Russian serfs. In order to reorganize local government, Catherine divided Russia into fifty provinces, each of which in turn was subdivided into districts whose ruling officials were chosen by the nobles. In this way, the local nobility became responsible for the day-to-day governing of Russia. Moreover, the

Peter the Great was followed by a series of six successors who were made and unmade by the palace guard. The last of these six was Peter III, whose German wife Catherine learned Russian and won the favor of the palace guard. Peter was murdered by a faction of nobles, and Catherine II the Great (1762–1796) emerged as autocrat of all the Russias.

Catherine was an intelligent woman who was familiar with the works of the philosophes. Voltaire and Diderot were among her correspondents, although some historians believe she corresponded with philosophes simply to improve her image abroad. Catherine claimed that she wished to reform Russia along the lines of Enlightenment ideas, but she was always shrewd enough to realize that her success depended upon the support of the palace guard and the gentry class from which it stemmed. She could not afford to alienate the Russian nobility.

Initially, Catherine seemed eager to pursue reform. She called for the election of an assembly in 1767 to debate the details of a new law code. In her Instruction, written as a guide to the deliberations, Catherine questioned the institution of serfdom, torture, and capital punishment and even advocated the principle of the equality of all people in the eyes of the law. But one and one-half years of negotiation produced little real change.

In fact, Catherine’s subsequent policies had the effect of strengthening the landholding class at the expense of all others, especially the Russian serfs. In order to reorganize local government, Catherine divided Russia into fifty provinces, each of which in turn was subdivided into districts whose ruling officials were chosen by the nobles. In this way, the local nobility became responsible for the day-to-day governing of Russia. Moreover, the
gentry were now formed into corporate groups with special legal privileges, including the right to trial by peers and exemption from personal taxation and corporal punishment. A Charter of the Nobility formalized these rights in 1785.

Catherine’s policy of favoring the landed nobility led to even worse conditions for the Russian peasantry. In 1767, serfs were forbidden to appeal to the state against their masters. The attempt of the Russian government to impose restrictions upon free peasants in the border districts of the Russian Empire soon led to a full-scale revolt that spread to the Volga valley. It was intensified by the support of the Cossacks, independent tribes of fierce warriors who had at times fought for the Russians against the Turks but now resisted the government’s attempt to absorb them into the empire.

An illiterate Cossack, Emelyan Pugachev, succeeded in welding the disparate elements of discontent into a mass revolt. Beginning in 1773, Pugachev’s rebellion spread across southern Russia from the Urals to the Volga River. Initially successful, Pugachev won the support of many peasants when he issued a manifesto in July 1774, freeing all peasants from oppressive taxes and military service. Encouraged to seize their landlords’ estates by Pugachev, the peasants responded by killing more than 1,500 estate owners and their families. The rebellion soon faltered, however, as government forces rallied and became more effective. Betrayed by his own subordinates, Pugachev was captured, tortured, and executed. The rebellion collapsed completely, and Catherine responded with even greater repression of the peasantry. All rural reform was halted; serfdom was expanded into newer parts of the empire, and peasants on crown land were also reduced to serfdom.

Above all, Catherine proved a worthy successor to Peter the Great by expanding Russia’s territory westward (into Poland) and southward (to the Black Sea). Russia spread southward by defeating the Turks. In the Treaty of Kuchuk-Kainarji in 1774, the Russians gained some land, the privilege of protecting Greek Orthodox Christians in the Ottoman Empire, and the right to sail in Turkish waters. Russian expansion westward occurred at the expense of neighboring Poland. In the three partitions of Poland, Russia gained about 50 percent of Polish territory.

THE DESTRUCTION OF POLAND
Poland was an excellent example of why a strong monarchy was needed in early modern Europe. The failure to develop the machinery of state building because of the excessive powers of the aristocracy proved disastrous. The Polish king was elected by the Polish nobles and forced to accept drastic restrictions upon his power, including limited revenues, a small bureaucracy, and a standing army of no more than 20,000 soldiers. For Polish nobles, these

CATHERINE THE GREAT. Autocrat of Russia, Catherine was an intelligent ruler who favored reform. She found it expedient, however, to retain much of the old system in order to keep the support of the landed nobility. In this portrait by Dmitry Levitsky, she is shown in legislative regalia in the Temple of Justice in 1783.
limitations eliminated an absolute king; for Poland’s powerful neighbors, they were an invitation to meddle in its affairs.

The total destruction of the Polish state in the eighteenth century arose out of the rivalries of its three great neighbors, Austria, Russia, and Prussia. To avoid war, the leaders of these powers decided to compensate themselves by dividing Poland. To maintain the balance of power in central and eastern Europe, the three great powers cynically agreed to the acquisition of roughly equal territories at Poland’s expense.

In 1772, Poland lost about 30 percent of its land and 50 percent of its population. Austria gained the agriculturally rich district of Galicia, Russia took the largest slice of land in eastern Poland, and Prussia acquired West Prussia, the smallest but most valuable territory because it united two of the chief sections of Prussia.

The remaining Polish state was supposedly independent; in truth, it was dominated by the Russians who even kept troops on Polish territory. After the Poles attempted to establish a stronger state under a hereditary monarchy in 1791, the Russians gained the support of Austria and Prussia and intervened militarily in May 1792. In the following year, Russia and Prussia undertook a second partition of Polish territory. Finally, after a heroic but hopeless rebellion in 1794–1795 under the General
Thaddeus Kosciuszko, the remaining Polish state was obliterated by Austria, Prussia, and Russia in the third partition of Poland (1795). Many historians have pointed to Poland’s demise as a cogent example of why building a strong, absolutist state was essential to survival in the seventeenth and eighteenth centuries.

**The Mediterranean World**

At the beginning of the eighteenth century, Spain experienced a change of dynasties from the Habsburgs to the Bourbons. Bourbon rule temporarily rejuvenated Spain and at least provided an opportunity to centralize the institutions of the state. Under Philip V (1700–1746), the laws, administrative institutions, and language of Castile were established in the other Spanish kingdoms, making the king of Castile truly the king of Spain. Moreover, French-style ministries replaced the old conciliar system of government, and officials similar to French intendants were introduced into the various Spanish provinces.

Since the Treaty of Utrecht in 1713 had taken the Italian territories and Netherlands away from Spain, the latter now had fewer administrative problems and less drain on its already overtaxed economic resources. In the second half of the eighteenth century, especially during the reign of Charles III (1759–1788), the Catholic church was also brought under control when the king banished the Jesuits and circumscribed the activities of the Inquisition. The landed aristocracy continued to exercise substantial power throughout the eighteenth century, however.

Portugal had experienced decline since the glorious days of empire in the sixteenth century. Nevertheless, during the long ministry of the marquis of Pombal (1699–1782), who served as chief minister to a series of Portuguese kings, the nobility and Catholic church were curtailed and the Portuguese empire temporarily revived. After Pombal was removed from office, the nobility and church regained much of their power.

After the Treaty of Utrecht, Austria had replaced Spain as the dominant force in Italy in the eighteenth century. The duchy of Milan, Sardinia, and the kingdom of Naples were all surrendered to the Habsburg emperors, and Sicily was given to the northern Italian state of Savoy, which was slowly emerging as a state with “an appetite for territorial expansion.” In 1734, the Bourbons of Spain reestablished control over Naples and Sicily. Though some Italian states, such as Venice and Genoa, remained independent, they grew increasingly impotent in international affairs.

**The Scandinavian States**

In the seventeenth century, Sweden had become the dominant power in northern Europe, but after the Battle of Poldava in 1709, Swedish power declined rapidly. Following the death of the powerful Charles XII in 1718, the Swedish nobility, using the Swedish diet as its instrument, gained control of public life and reduced the monarchy to puppet status. But the division of the nobility into pro-French and pro-Russian factions eventually enabled King Gustavus III (1771–1792) to reassert the power of the monarchy. Gustavus proved to be one of the “most enlightened monarchs of his age.” By decree, he established freedom of religion, speech, and press and instituted a new code of justice that eliminated the use of torture. Moreover, his economic reforms smacked of laissez-faire: he reduced tariffs, abolished tolls, and encouraged trade and agriculture. In 1792, however, a group of nobles, incensed at these reforms and their loss of power, assassinated the king, but they proved unable to fully restore the rule of the aristocracy.

Denmark also saw an attempt at enlightened reforms by King Christian VII (1766–1808) and his chief minister, John Frederick Struensee. Aristocratic opposition stymied their efforts, however, and led to Struensee’s death in 1772.

**Enlightened Absolutism Revisited**

The subject of enlightened absolutism revolves around the relationship between “an intellectual movement and the actual practice of government.” The ideas of the Enlightenment did have an impact on rulers after 1750. Almost every European ruler in the second half of the eighteenth century pursued some enlightened reforms, be they reform of laws, the development of secondary education, or religious tolerance. Few rulers, however, felt compelled to make the state an experimental lab for a set of political principles. Of the three major rulers traditionally associated most closely with enlightened absolutism—Joseph II, Frederick II, and Catherine the Great—only Joseph II sought truly radical changes based on Enlightenment ideas. Both Frederick and Catherine liked to be cast as disciples of the Enlightenment,
expressed interest in enlightened reforms, and even attempted some, but the policies of neither seemed seriously affected by Enlightenment thought. Necessities of state and maintenance of the existing system took precedence over reform. Indeed, many historians feel that Joseph, Frederick, and Catherine were all primarily guided by a concern for the power and well-being of their states and that their policies were not all that different from those of their predecessors. In the final analysis, heightened state power was used to amass armies and wage wars to gain more power. Nevertheless, in their desire to build stronger state systems, these rulers did pursue such enlightened reforms as legal reform, religious toleration, and the extension of education because these served to create more satisfied subjects and strengthened the state in significant ways.

It would be foolish, however, to overlook the fact that political and social realities limited the ability of enlightened rulers to make reforms. Everywhere in Europe the hereditary aristocracy was still the most powerful class in society. Enlightened reforms were often limited to changes in the administrative and judicial systems that did not seriously undermine the powerful interests of the European nobility. Although aristocrats might join the populace in opposing monarchical extension of centralizing power, as the chief beneficiaries of a system based on traditional rights and privileges for their class, they were certainly not willing to support a political ideology that trumpeted the principle of equal rights for all.

**Wars and Diplomacy**

The philosophes had denounced war as a foolish waste of life and resources in stupid quarrels of no value to humankind. Rulers, however, paid little attention to these comments and continued their costly struggles. By the eighteenth century, the European system of self-governing, individual states was grounded largely in the principle of self-interest. Because international relations were based on considerations of power, the eighteenth-century concept of a “balance of power” was predicated on how to counterbalance the power of one state by another to prevent any one power from dominating the others. This balance of power, however, did not imply a desire for peace. Large armies created to defend a state’s security were often used for offensive purposes as well. As Frederick the Great of Prussia remarked: “The fundamental rule of governments is the principle of extending their territories.” Nevertheless, the regular use of diplomacy served at times to lead to compromise.

The diplomacy of the eighteenth century still focused primarily on dynastic interests or the desire of ruling families to provide for their dependents and extend their dynastic holdings. But the eighteenth century also saw the emergence of the concept of “reason of state,” on the basis of which a ruler such as Frederick II and a minister such as William Pitt the Elder looked beyond dynastic interests to the long-term future of their states.

International rivalry and the continuing centralization of the European states were closely related. The need for taxes to support large armies and navies created its own imperative for more efficient and effective control of power in the hands of bureaucrats who could collect taxes and organize states for the task of winning wars. At the same time, the development of large standing armies ensured that political disputes would periodically be resolved by armed conflict rather than diplomacy. Between 1715 and 1740, it had seemed that Europe preferred peace. But in 1740, a major conflict erupted over the succession to the Austrian throne.

**The War of the Austrian Succession (1740–1748)**

Unable to produce a male heir to the Austrian throne, the Habsburg emperor Charles VI (1711–1740) so feared the consequences of the succession of his daughter Maria Theresa that he spent much of his reign negotiating the Pragmatic Sanction by which different European powers agreed to recognize his daughter as his legal heir.

Charles, however, failed to foresee the faithlessness and duplicity of Europe’s rulers. After his death, the Pragmatic Sanction was conveniently pushed aside, especially by Frederick II who had just succeeded to the throne of Prussia. The new Prussian ruler took advantage of the new empress to invade Austrian Silesia. At the same time, the ruler of the south German state of Bavaria seized some Habsburg territory and had himself chosen as the new Holy Roman Emperor. The vulnerability of Maria Theresa encouraged France to enter the war against its traditional enemy Austria; in turn, Maria Theresa made an alliance with Great Britain who feared French hegemony over continental affairs. All too quickly, the Austrian succession had produced a worldwide conflagration. The war was fought not only in Europe where Prussia seized Silesia, and France occupied the Austrian Netherlands, but in the East where France took Madras in India from the British and in North America where the British captured the French fortress of Louisbourg at the entrance to the St. Lawrence River. By 1748, all parties were exhausted and agreed to stop. The peace treaty of Aix-la-Chapelle promised the return of all occupied territories except Silesia to their original owners. Prussia’s refusal to return Silesia guaranteed another war, at least between the two hostile central European powers of Prussia and Austria.

**The Seven Years’ War (1756–1763)**

Maria Theresa refused to accept the loss of Silesia and prepared for its return by rebuilding her army while working diplomatically through her able foreign minister, Count
Wenzel von Kaunitz, to separate Prussia from its chief ally, France. In 1756, Austria achieved what was soon labeled a diplomatic revolution. Bourbon-Habsburg rivalry had been a fact of European diplomacy since the late sixteenth century. But two new rivalries made this old one seem superfluous: Britain and France over colonial empires, and Austria and Prussia over Silesia. France now abandoned Prussia and allied with Austria. Russia, which saw Prussia as a major hindrance to Russian goals in central Europe, joined the new alliance. In turn, Great Britain allied with Prussia. This diplomatic revolution of 1756 now led to another worldwide war.

There were three major areas of conflict: Europe, India, and North America. Europe witnessed the clash of the two major alliances: the British and Prussians against the Austrians, Russians, and French. With his superb army and military prowess, Frederick the Great was able for some time to defeat the Austrian, French, and Russian armies. He won a spectacular victory at the Battle of Rossbach in Saxony (1757) over combined French-Austrian forces that far outnumbered his own troops. Under attack from three different directions, however, the forces of Frederick II were gradually worn down and faced utter defeat when they were saved by the death of Tsarina Elizabeth of Russia, which brought her nephew Peter III to power. A great admirer of Frederick the Great, Peter withdrew the Russian troops from the conflict and from the Prussian lands that they had occupied. His withdrawal guaranteed a stalemate and led to a desire for peace. The European conflict was ended by the Peace of Hubertusburg in 1763. All occupied territories were returned, and Austria officially recognized Prussia’s permanent control of Silesia.

The Anglo-French struggle in the rest of the world had more decisive results. Known as the Great War for Empire, it was fought in India and North America. The French had returned Madras to Britain after the War of the Austrian Succession, but jockeying for power continued as the French and British supported opposing native Indian princes. The British under Robert Clive (1725–1774) ultimately won out, not because they had better forces but because they were more persistent. By the Treaty of Paris in 1763, the French withdrew and left India to the British.

By far, the greatest conflicts of the Seven Years’ War took place in North America. There were two primary areas of contention. One consisted of the waterways of the Gulf of St. Lawrence, guarded by the fortress of Louisbourg and by forts near the Great Lakes and Lake Champlain that protected French Quebec and French traders. The other was the unsettled Ohio River valley. As the French moved south from the Great Lakes and north from their forts on the Mississippi, they began to establish forts from the Appalachians to the Mississippi River. To the British settlers in the thirteen colonies to the east, this French activity threatened to cut off a vast area from British
British Victory at Quebec

One of the major battles of the Seven Years’ War in North America occurred in Canada in 1759 when British forces under General James Wolfe defeated the French under General Louis-Joseph Montcalm outside Quebec. This description of the important battle is taken from a detailed account of the British campaign in North America by Captain John Knox, an experienced soldier.

John Knox, Historical Journal of the Campaign in North America

Before daybreak this morning [September 13, 1759] we made a descent upon the north shore, about half a quarter of a mile to the eastward of Sillery. . . . We had in this debarkation thirty flat-bottomed boats, containing about sixteen hundred men. This was a great surprise on the enemy, who from the natural strength of the place did not suspect, and consequently were not prepared against so bold an attempt. The chain of sentries which they had posted along the summit of the heights galled us a little, and picked off several men and some officers before our light infantry got up to dislodge them. This great enterprise was conducted and executed with great good order and discretion.

As fast as we landed the boats put off for reinforcements, and the troops formed with much regularity. General Wolfe . . . was ashore with the first division. We lost no time here, but clambered up one of the steepest precipices that can be conceived, being almost a perpendicular, and of an incredible height. As soon as we gained the summit all was quiet, and not a shot was heard, owing to the excellent conduct of the light infantry under Colonel Howe. It was by this time clear daylight. Here we formed again . . . and halted a few minutes. . . . We then faced to the right, and marched toward the town by files till we came to the Plains of Abraham, an even piece of ground which Mr. Wolfe had made choice of, while we stood forming upon the hill.

Weather showery. About six o’clock the enemy first made their appearance upon the heights between us and the town, whereupon we halted and wheeled to the right, thereby forming the line of battle. . . .

About ten o’clock the enemy began to advance briskly in three columns, with loud shots and recovered arms . . . from the distance of one hundred and thirty, until they came within forty yards, which our troops withstood with the greatest firmness, still preserving their fire and paying the strictest obedience to their officers. This uncommon steadiness, together with the havoc which the grape-shot from our field-pieces made among them, threw them into some disorder and was most critically maintained by a well-timed, regular, and heavy discharge of our small arms, such as they could no longer oppose. Hereupon they gave way, and fled, so that by the time the cloud of smoke was vanished our men were again over them, pursued them almost to the gates of the town and the bridge over the little river, making many officers and men prisoners. . . .

Our joy at this success is inexpressibly damped by the loss we sustained of one of the greatest heroes which this or any other age can boast of—General James Wolfe. . . . After he was carried off wounded to the rear of the front line, he desired those who were about him to lay him down. Being asked if he would have a surgeon, he replied, “It is needless: it is all over with me.” One of them cried out, “They run, see how they run!” “Who runs?” demanded our hero with great earnestness, like a person roused from sleep. The officer answered, “The enemy, sir. Egad, they give way everywhere.” Thereupon the general rejoined: “Go, one of you, my lads, to Colonel Burton; tell him to march Webb’s regiment with all speed down to Charles River, to cut off the retreat of the fugitives from the bridge.” Then, turning on his side, he added, “Now, God be praised, I will die in peace!” and thus expired.

exploitation. The French found allies among the Indians, who considered the French traders less threatening than the British settlers.

Despite initial French successes, British fortunes were revived by the efforts of William Pitt the Elder who was convinced that the destruction of the French colonial empire was a necessary prerequisite for the creation of Britain’s own colonial empire. Accordingly, Pitt decided to make a minimal effort in Europe while concentrating resources, especially the British navy, on the colonial war. Although French troops were greater in number, the ability of the French to use them in the New World was contingent upon naval support. The defeat of French fleets in major naval battles in 1759 gave the British an advantage since the French could no longer easily reinforce their garrisons. A series of British victories soon followed. In 1758, Forts Louisbourg and Duquesne were captured. On the night of September 13, 1759, British forces led by General James Wolfe scaled the heights outside Quebec and defeated the French under General Louis-Joseph Montcalm on the Plains of Abraham (see the box above). Both generals died in the battle. The British went on to seize Montreal, the Great Lakes area, and the Ohio valley. The French were forced to make peace. By the Treaty of Paris, they ceded Canada and the lands east of the Mississippi to Britain. Their ally Spain transferred Spanish Florida to British control; in return, the French gave their Louisiana territory to the Spanish. By 1763, Great Britain had become the world’s greatest colonial power.
European Armies and Warfare

The professional standing army, initiated in the seventeenth century, became a standard feature of eighteenth-century Europe. Especially noticeable was the increase in the size of armies, which paralleled the development of absolutist states. Between 1740 and 1780, the French army grew from 190,000 to 300,000 men; the Prussian from 83,000 to 200,000; the Austrian from 108,000 to 282,000; and the Russian from 130,000 to 290,000.

The composition of these armies reflected the hierarchical structure of European society and the great chasm that separated the upper and lower classes. Officers were primarily from the landed aristocracy, which had for centuries regarded military activity as one of its major functions. Prussia made military service compulsory for its nobles and forced the teenage sons of aristocrats to attend a military academy in Berlin for training as officers. Middle-class individuals were largely kept out of the higher ranks of the officer corps while being admitted to the middle ranks. A prejudice against commoners in the officer corps remained a regular feature of military life in the eighteenth century.

Rank-and-file soldiers came mostly from the lower classes of society. Some states, such as Prussia and Russia, conscripted able-bodied peasants. But many states realized that this was counterproductive since they could not afford to waste their farmers. For that reason, eighteenth-century armies were partially composed of foreign troops, many from Switzerland or the petty German states. Of the great powers, Britain alone had no regular standing army and relied on mercenaries, evident in its use of German troops in America. Most troops in European armies, especially the French and Austrian, were natives who enlisted voluntarily for six-year terms. Some were not exactly volunteers; often vagabonds and the unemployed were pressed into service. Most, however, came from the lower classes—peasants and also artisans from the cities—who saw the military as an opportunity to escape from hard times or personal problems.

The maritime powers, such as Britain and the Dutch Republic, regarded navies as more important than armies. In the second half of the eighteenth century, the British possessed 174 warships manned by 80,000 sailors. Conditions on these ships were often poor. Diseases such as scurvy and yellow fever were rampant, and crews were frequently press-ganged into duty.

The dramatic increase in the size of armies and navies did not necessarily result in more destructive warfare in eighteenth-century Europe. For one thing, warfare was no longer driven by ideology as the religious wars of the sixteenth and seventeenth centuries had been. By their very nature, ideological wars are often violent and destructive. Moreover, since the larger armies depended upon increased tax revenues, rulers regarded the wanton destruction of civilian taxpayers as foolish. Finally, the costliness of eighteenth-century armies as well as the technology and tactical traditions of the age created a system of warfare based on limited objectives.

Since generals were extremely reluctant to risk the destruction of their armies in pitched battles, clever and elaborate maneuvers, rather than direct confrontation, became fashionable. A system of formalities accepted by all sides allowed defeated opponents to withdraw without being captured or destroyed. This mentality also encouraged the construction of vast fortresses to secure major roads and the enormous quantities of supplies needed by eighteenth-century armies. With its own set patterns of tactics, siege warfare often became, as one French critic said disgustedly, “the art of surrendering strongholds honorably after certain conventional formalities.” Nevertheless, despite the maneuvering and the sieges, European
warfare in the eighteenth century also involved many battles and considerable risk.

**Economic Expansion and Social Change**

The economic depression that had characterized the seventeenth century began to end in the early eighteenth century. Rapid population growth, expansion in banking and trade, an agricultural revolution (at least in Britain), the beginnings of a new pattern of industrialization, and an increase in worldwide trade characterized the economic patterns of the eighteenth century.

**Growth of the European Population**

The cycles of population growth and decline that had characterized Europe since the Middle Ages came to an end in the eighteenth century. Despite regional variations, Europe's population began to grow around 1750 and continued a “slow but irreversible upward movement.” It has been estimated that the total European population was around 120 million in 1700, expanded to 140 million by 1750, and then grew to 190 million by 1790; thus, the growth rate in the second half of the century was double that of the first half. Individual states also experienced rapid growth between 1700 and 1790: Russia's population went from 14 million to 28 million (much of it due to territorial expansion); France from 20 to 26 or 27 million; Spain from 6 to 10 million; Brandenburg-Prussia from 1.5 to 5.5 million (over half of this came from territorial acquisition); and Britain from 5 or 6 to 9 million. These increases occurred during the same time that several million Europeans were going abroad as colonists.

Historical demographers are not sure of the causes of this population growth. Enough statistical studies have been done, however, to show that a falling death rate was perhaps most important, especially the decline in infant mortality rates. One study of several French parishes reveals that in the first part of the century the mortality rate for infants under one year was 29 percent and the rate for all children from birth to nineteen years was 51 percent, compared to 20 and 42 percent, respectively, in the 1780s. Although the percentage of decrease seems small, it is statistically significant enough to cause a noticeable increase in population.

But why the decline in the death rate? Historians are not sure. Certainly, it was not from improved health care since little change occurred in that area until the end of the eighteenth century. No doubt, more plentiful food and better transportation of available food supplies led to some improvement in diet and relief from devastating famines. Also of great significance was the lowering of death rates that accompanied the end of the bubonic plague. The last great outbreak in western Europe occurred in 1720 in southern France. Nevertheless, despite the increase in population, death was still a ubiquitous feature of everyday life. Other diseases, such as typhus, smallpox, influenza, and dysentery, were rampant, especially since hygienic conditions remained poor—little bathing, dirty clothes, and no systematic elimination of human wastes. Despite the improved transportation, famine and hunger could still be devastating. As a small textile merchant in Germany wrote in 1770: “And the misery grew so much that poor people could only hope for spring when they could find roots and herbs. And I had to cook that sort of stuff.”

**Family, Marriage, and Birthrate Patterns**

The family, rather than the individual, was still at the heart of Europe's social organization. For the most part, people still thought of the family in traditional terms, as a patriarchal institution with the husband dominating his wife and children. The upper classes in particular were still concerned for the family as a “house,” an association whose collective interests were more important than those of its individual members. Parents (especially the fathers) still generally selected marriage partners for their children based on the interests of the family. One French noble responded to his son's inquiry about his upcoming marriage: “Mind your own business.”

At the beginning of the eighteenth century, traditional attitudes also prevailed in the care of children. Generally, lower-class women breast-fed their own children because it provided the best nourishment. Moreover, since there were strong taboos in various parts of Europe against sexual intercourse while one was breast-feeding, mothers might also avoid another immediate pregnancy; if the infant died, they could then have another child. Lower-class women, however, also served as wet nurses for children of the aristocratic and upper middle classes. Mothers from these higher social strata considered breast-feeding undignified and hired wet nurses instead. Even urban mothers, the wives of artisans, for economic reasons sent their babies to wet nurses in the countryside.
they could, making the practice widespread in the eighteenth century.

In the second half of the eighteenth century, traditional attitudes began to alter, especially in western Europe. The impact of Enlightenment thought, such as Rousseau’s *Emile*, and the increasing survival of more infants led to new attitudes toward children. Childhood was more and more viewed as a phase in human development. One result was a shift to dressing children in more comfortable clothes appropriate to their age rather than dressing them in clothes modeled after adult styles. Shops for children’s clothes appeared for the first time. Primogeniture or the practice of treating the first son as the favorite also came under attack. All children, it was argued, deserve their parents’ attention. Appeals for women to breast-feed their own children rather than use wet nurses soon followed. In England, games and toys specifically for children now appeared. The jigsaw puzzle was invented in the 1760s, and books, such as *Little Pretty Pocket-Book* (1744), aimed to please as well as teach children. These changes, however, were limited mostly to the upper classes of western European society and did not extend to the peasants. For most Europeans, children were still a source of considerable anxiety. They represented more mouths to feed and in times of economic crisis proved such a liability that infanticide was practiced and foundling homes were overcrowded.

Despite being punishable by death, infanticide remained a solution to the problem of too many children. So many children were being “accidentally” suffocated while in their parents’ bed that in Austria in 1784 a law was enacted that forbade parents to place children under five years old in bed with them. More common than infanticide was the placement of unwanted children in foundling homes or hospitals, which became a favorite charity of the rich in eighteenth-century Europe. The largest of its kind, located in St. Petersburg, Russia, was founded by members of the nobility. By the end of the century, it was taking in 5,000 new babies a year and caring for 25,000 children at one time.

But severe problems arose as the system became overburdened. One historian has estimated that in the 1770s one-third of all babies born in Paris were taken to foundling institutions by parents or desperate unmarried mothers, creating serious overcrowding. Foundling institutions often proved fatal for infants. Mortality rates ranged from 50 to as high as 90 percent (in a sense making foundling homes a legalized form of infanticide). Those who survived were usually sent to miserable jobs. The suffering of poor children was one of the blackest pages of eighteenth-century European history.

In most of Europe, newly married couples established their own households independent of their parents. This nuclear family, which had its beginning in the Middle Ages, had become a common pattern, especially in northwestern Europe. In order to save what they needed to establish their own households, both men and women (outside the aristocracy) married quite late; the average

---

**CHILDREN OF THE UPPER CLASSES.** This painting of John Bacon and his family illustrates an important feature of upper-class family life in Great Britain in the first half of the eighteenth century. The children appear as miniature adults, dressed in clothes modeled after the styles of their parents.
age for men in northwestern Europe was between twenty-seven and twenty-eight, for women between twenty-five and twenty-seven.

Late marriages imposed limits on the birthrate; in fact, they might be viewed as a natural form of birth control. But was this limitation offset by the number of babies born illegitimately? From the low illegitimacy rate of 1 percent in some places in France and 5 percent in some English parishes, it would appear that it was not, at least in the first half of the eighteenth century. After 1750, however, illegitimacy appears to have increased. Studies in Germany, for example, show that rates of illegitimacy increased from 2 percent in 1700 to 5 percent in 1760 and to 10 percent in 1800, followed by an even more dramatic increase in the early nineteenth century.

For married couples, the first child usually appeared within one year of marriage, and additional children came at intervals of two or three years, producing an average number of five births per family. It would appear then that the birthrate had the potential of creating a significant increase in population. This possibility was restricted, however, because 40 to 60 percent of European women of childbearing age (between fifteen and forty-four) were not married at any given time. Moreover, by the end of the eighteenth century, especially among the upper classes in France and Britain, birth control techniques were being used to limit the number of children. Figures for the French aristocracy indicate that the average number of children declined from six in the period between 1650 and 1700 to three between 1700 and 1750 and to two between 1750 and 1780. These figures are even more significant when one considers that aristocrats married at younger ages than the rest of the population. Coitus interruptus remained the most commonly used form of birth control.

Among the working classes, whether peasants or urban workers, the contributions of women and children to the “family economy” were often crucial. In urban areas, both male and female children either helped in the handicraft manufacturing done in the home or were sent out to work as household servants. In rural areas, children worked on the land or helped in the activities of cottage industry. Married women grew vegetables in small plots, tended livestock, and sold eggs, vegetables, and milk. Wives of propertyless agricultural workers labored in the fields or as textile workers, spinning or knitting. In the cities, wives of artisans helped their husbands at their crafts or worked as seamstresses. The wives of unskilled workers labored as laundresses and cleaners for the rich or as peddlers of food or used clothing to the lower classes. But the family economy was often precarious.

THE PRACTICE OF INFANTICIDE. Infanticide remained one of the solutions to the problem of too many children in the eighteenth century. This engraving recounts the story of one infanticide in Germany. Top left: the infant is discovered, smothered under a mattress. Bottom left: the mother is taken from prison to be executed. Right: a large crowd observes the execution of the mother for her crime.
Bad harvests in the countryside or a downturn in employment in the cities often reduced people to utter poverty and a life of begging.

**An Agricultural Revolution?**

Did improvements in agricultural practices and methods in the eighteenth century lead to an agricultural revolution? The topic is much debated. Some historians have noted the beginning of agrarian changes already in the seventeenth century, especially in the Low Countries. Others, however, have questioned the use of the term, arguing that significant changes occurred only in England and noting that even there the upward trend in agricultural production was not maintained after 1750.

Eighteenth-century agriculture was characterized by increases in food production that can be attributed to four interrelated factors: more land under cultivation, increased yields per acre, healthier and more abundant livestock, and an improved climate. Climatologists believe that the “little ice age” of the seventeenth century declined in the eighteenth, especially evident in the moderate summers that provided more ideal growing conditions.

The amount of land under cultivation was increased by abandoning the old open field system in which part of the land was left to lie fallow to renew it. New crops, such as alfalfa, turnips, and clover, which stored nitrogen in their roots and helped to restore the soil’s fertility, were planted in England, parts of France, and the Low Countries. These crops not only renewed the soil but also provided winter fodder for livestock, enabling landlords to maintain an ever-larger number of animals; some enterprising landlords also engaged in scientific breeding and produced stronger and more productive strains of animals.

The more numerous livestock increased the amount of meat in the European diet and enhanced food production by making available more animal manure, which was used to fertilize fields and produce better yields per acre. Increased yields were also encouraged by landed aristocrats who shared in the scientific experimentation of the age. In England, Jethro Tull (1674–1741) discovered that using a hoe to keep the soil loose allowed air and moisture to reach plants and enabled them to grow better. He also used a drill to plant seeds in rows instead of scattering them by hand, a method that had lost much seed to the birds.

The eighteenth century witnessed greater yields of vegetables, including two important American crops, the potato and maize (Indian corn). Although they were not grown in quantity until after 1700, both had been brought to Europe from America in the sixteenth century and were part of what some historians have called the Columbian exchange—a reciprocal exchange of plants and animals between Europe and America. The potato became a staple in Germany, the Low Countries, and especially Ireland, where repression by English landlords forced large numbers of poor peasants to survive on small pieces of marginal land. The potato took relatively little effort to produce in large quantities. High in carbohydrates and calories, rich in vitamins A and C, it could be easily stored for winter use.

The new agricultural techniques were considered best suited to large-scale farms. Consequently, a change in landholding accompanied the increase in food production. Large landowners or yeomen farmers enclosed the old open fields, combining the many small holdings that made up the fields into larger units. The end of the open field system led to the demise of the cooperative farming of the village community. In England, where small landholders resisted this process, Parliament, dominated by the landed aristocracy, enacted legislation allowing agricultural lands to be legally enclosed. As a result of these enclosure acts, England gradually became a land of large estates, and many small farmers were forced to become wage laborers or tenant farmers working farms of 100–500 acres. Although some historians have emphasized the advantages of enclosures in enabling large landowners to practice new agricultural techniques and increase food production, the enclosure movement and new agricultural practices also effectively destroyed the traditional patterns of English village life.

In the eighteenth century, the English were the leaders in adopting the new techniques that have been characterized as an agricultural revolution (see the box on p. 538). This early modernization of English agriculture with its noticeable increase in productivity made possible the feeding of an expanding population about to enter a new world of industrialization and urbanization.

**New Methods of Finance and Industry**

The decline in the available supply of gold and silver in the seventeenth century had created a chronic shortage of money that undermined the efforts of governments to meet their needs. The creation of new public and private banks and the acceptance of paper notes made possible an expansion of credit in the eighteenth century.

Perhaps the best example of this process can be observed in England where the Bank of England was founded in 1694. Unlike other banks accustomed to receiving deposits and exchanging foreign currencies, the Bank of England also made loans. In return for lending money to the government, the bank was allowed to issue paper “bank notes” backed by its credit. These soon became negotiable and provided a paper substitute for gold and silver currency. In addition, the issuance of government bonds paying regular interest, backed by the Bank of England and the London financial community, created the notion of a public or “national debt” distinct from the monarch’s personal debts. This process meant that capital for financing larger armies and other government undertakings could be raised in ever-greater quantities.

These new financial institutions and methods were not risk-free, however. In both Britain and France in the early eighteenth century, speculators provided opportunities for people to invest in colonial trading companies. The French company under John Law was also tied to his
attempt to create a national bank and paper currency for France. When people went overboard and drove the price of the stock to incredibly high levels, the bubble burst. Law's company and bank went bankrupt, leading to a loss of confidence in paper money that prevented the formation of a French national bank. Consequently, French public finance developed slowly in the eighteenth century.

This was not the case in Britain, however. Despite crises, public confidence in the new financial institutions enabled the British government to borrow large sums of money at relatively low rates of interest, giving it a distinct advantage in the struggle with France. According to a contemporary observer, Britain's public credit was "the permanent miracle of her policy, which has inspired both astonishment and fear in the States of Europe." 

The decline of Dutch trade, industry, and power meant that Dutch capitalists were inclined to lend money abroad because they had fewer opportunities at home.

The most important product of European industry in the eighteenth century was textiles. Woolen cloth made up 75 percent of Britain's exports in the early eighteenth century. France, too, was a leader in the production of woolen cloth, and other major states emulated both France and Britain by encouraging the development of their own textile industries.

Most textiles were still produced by traditional methods. In cities that were textile centers, master artisans employed timeworn methods to turn out finished goods in their guild workshops. But by the eighteenth century textile production was beginning to shift to the countryside in parts of Europe. In the countryside, textiles were produced by the "putting-out" or "domestic" system in which a merchant-capitalist entrepreneur bought the raw materials, mostly wool and flax, and "put them out" to rural workers who spun the raw material into yarn and...
Propaganda for the New Agriculture

Enthusiastic supporters of the new English agricultural practices went to the continent to examine less efficient kinds of farming. One of these Englishmen, Arthur Young, wrote an account of his travels in which he blamed the low yields of French farmers on the old system of allowing part of the land to lie fallow and the small size of the farms. The latter factor was especially important to English aristocratic landholders who wished to justify the enclosure movement. This selection is taken from Young’s account.

Arthur Young, Travels during the Years, 1787, 1788, and 1789 . . . in the Kingdom of France

The Englishman, in eleven years, gets three bushels more of wheat than the Frenchman. He gets three crops of barley, oats, or beans, which produce nearly twice as many bushels per acre, as what the three French crops of spring corn produce. And he farther gets, at the same time, three crops of turnips, and two of clover, the turnips worth 40s., the acre, and the clover 60s. That is 121 for both. What an enormous superiority. More wheat; almost double of the spring corn; and above 20s. per acre per annum in turnips and clover. But farther;

then wove it into cloth on simple looms. Capitalist-entrepreneurs sold the finished product, made a profit, and used it to manufacture more. This system became known as the “cottage industry,” because spinners and weavers did their work on spinning wheels and looms in their own cottages. Cottage industry was truly a family enterprise since women and children could spin while men wove on the looms, enabling rural people to earn incomes that supplemented their pitiful wages as agricultural laborers.

The cottage system utilized traditional methods of manufacturing and spread to many areas of rural Europe in the eighteenth century. But significant changes in industrial production also began to occur in the second half of the century, pushed along by the introduction of cotton, originally imported from India. The importation of raw cotton from slave plantations encouraged the production of cotton cloth in Europe where a profitable market developed because of the growing demand for lightweight cotton clothes that were less expensive than linens and woolens. But the traditional methods of the cottage industry proved incapable of keeping up with the growing demand, leading English cloth entrepreneurs to develop new methods and new machines. The flying shuttle sped up the process of weaving on a loom, thereby increasing the need for large quantities of yarn. In response, Richard Arkwright (1732–1792) invented a “water frame,” powered by horse or water, which turned out yarn much faster than cottage spinning wheels. This abundance of yarn, in turn, led to the development of mechanized looms, invented in the 1780s but not widely adopted until the early nineteenth century. By that time Britain was in the throes of an industrial revolution, but already at the end of the eighteenth century, rural workers, perceiving that the new machines threatened their traditional livelihood, had begun to call for the machines’ destruction (see the box on p. 539).

Toward a Global Economy: Mercantile Empires and Worldwide Trade

Though bankers and industrialists came to dominate the economic life of the nineteenth century, in the eighteenth century merchants and traders still reigned supreme. Trade within Europe still dominated total trade figures as wheat, timber, and naval stores from the Baltic, wines from France, wool and fruit from Spain, and silk from Italy were exchanged along with a host of other products. But the eighteenth century witnessed only a slight increase in this trade while overseas trade boomed. From 1716 to 1789, total French exports quadrupled; intra-European trade, which constituted 75 percent of these exports in 1716, constituted only 50 percent of the total in 1789. This increase in overseas trade has led some historians to speak of the emergence of a truly global economy in the eighteenth century. By the beginning of the century, Spain, Portugal, and the Dutch Republic, which had earlier monopolized over-
The Beginnings of Mechanized Industry: The Attack on New Machines

Already by the end of the eighteenth century, mechanization was beginning to bring changes to the traditional cottage industry of textile manufacturing. Rural workers who depended on the extra wages earned in their own homes often reacted by attacking the machinery that threatened their livelihoods. This selection is a petition that English wool workers published in their local newspapers asking that machines no longer be used to prepare wool for spinning.

**The Leeds Woolen Workers’ Petition (1786)**

To the Merchants, Clothiers and all such as wish well to the Staple Manufactory of this Nation.

The Humble ADDRESS and PETITION of Thousands, who labor in the Cloth Manufactory.

The Scribbling-Machines have thrown thousands of your petitioners out of employ, whereby they are brought into great distress, and are not able to procure a maintenance for their families, and deprived them of the opportunity of bringing up their children to labor: We have therefore to request, that prejudice and self-interest may be laid aside, and that you may pay that attention to the following facts, which the nature of the case requires.

The number of Scribbling-Machines extending about seventeen miles southwest of LEEDS, exceed all belief, being no less than one hundred and seventy! and as each machine will do as much work in twelve hours, as ten men can in that time do by hand (speaking within bounds) and they working night and day, one machine will do as much work in one day as would otherwise employ twenty men.

As we do not mean to assert any thing but what we can prove to be true, we allow four men to be employed at each machine twelve hours, working night and day, will take eight men in twenty-four hours; so that, upon a moderate computation twelve men are thrown out of employ for every single machine used in scribbling; and as it may be supposed the number of machines in all the other quarters together, nearly equal those in the South-West, full four thousand men are left to shift for a living how they can, and must of course fall to the Parish, if not time relieved. Allowing one boy to be bound apprentice from each family out of work, eight thousand hands are deprived of the opportunity of getting a livelihood.

We therefore hope, that the feelings of humanity will lead those who have it in their power to prevent the use of those machines, to give every discouragement they can to what has a tendency so prejudicial to their fellow-creatures. . . .

We wish to propose a few queries to those who would plead for the further continuance of these machines:

How are those men, thus thrown out of employ to provide for their families; and what are they to put their children apprentice to, that the rising generation may have something to keep them at work, in order that they may not be like vagabonds strolling about in idleness? Some day, Begin and learn some other business—Suppose we do, who will maintain our families, whilst we undertake the arduous task; and when we have learned it, how do we know we shall be any better for all our pains; for by the time we have served our second apprenticeship, another machine may arise, which may take away that business also. . . .

But what are our children to do; are they to be brought up in idleness? Indeed as things are, it is no wonder to hear of so many executions; for our parts, though we may be thought illiterate men, our conceptions are, that bringing children up to industry, and keeping them employed, is the way to keep them from falling into those crimes, which an idle habit naturally leads to.

seas trade, found themselves increasingly overshadowed by France and Britain. The rivalry between these two great western European powers was especially evident in the Americas and the East.

**COLONIAL EMPIRES**

Both the French and British colonial empires in the New World included large parts of the West Indies and the North American continent. In the former, the British held Barbados, Jamaica, and Bermuda, and the French possessed Saint Dominique, Martinique, and Guadeloupe. On these tropical islands, both the British and the French had developed plantation economies, worked by African slaves, which produced tobacco, cotton, coffee, and sugar, all products increasingly in demand in Europe.

The French and British colonies on the North American continent were structured in different ways. French North America (Canada and Louisiana) was run autocratically as a vast trading area, where valuable furs, leather, fish, and timber were acquired. However, the inability of the French state to get its people to emigrate to these North American possessions left them thinly populated.

British North America had come to consist of thirteen colonies on the eastern coast of the present United States. They were thickly populated, containing about 1.5 million people by 1750, and were also prosperous. Supposedly run by the British Board of Trade, the Royal Council, and Parliament, these thirteen colonies had legislatures that tended to act independently. Merchants in
such port cities as Boston, Philadelphia, New York, and Charleston resented and resisted regulation from the British government.

Both the North American and West Indian colonies of Britain and France were assigned roles in keeping with mercantilist theory. They provided raw materials for the mother country while buying the latter’s manufactured goods. Navigation acts regulated what could be taken from and sold to the colonies. Theoretically, the system was supposed to provide a balance of trade favorable to the mother country.

British and French rivalry was also evident in the Spanish and Portuguese colonial empires in Latin America. The decline of Spain and Portugal had led these two states to depend even more on resources from their colonies, and they imposed strict mercantilist rules to keep others out. Spain, for example, tried to limit all trade with its colonies to Spanish ships. But the British and French were too powerful to be excluded. The British cajoled the Portuguese into allowing them into the lucrative Brazilian trade. The French, however, were the first to break into the Spanish Latin American market when the French Bourbons became kings of Spain. Britain’s entry into Spanish American markets first came in 1713, when the British were granted the privilege, known as the asiento, of transporting 4,500 slaves a year into Spanish Latin America.

The rivalry also extended to the East where Britain and France competed for the tea, spices, cotton, hard woods, and luxury goods of India and the East Indies. The rivalry between the two countries was played out by their state-backed national trading companies. In the course of the eighteenth century, the British defeated the French, and by the mid-nineteenth century, they had assumed control of the entire Indian subcontinent.

GLOBAL TRADE
To justify the term global economy, historians have usually pointed to the patterns of trade that interlocked Europe, Africa, the East, and the American continents. In an example of triangular trade, British merchant ships carried British manufactured goods to Africa, where they were traded for a cargo of slaves, which were then shipped to Virginia and paid for by tobacco, which in turn was shipped back to England where it was processed and then sold in Germany for cash.

Of all the goods traded in the eighteenth century, perhaps the most profitable and certainly the most infamous were African slaves. Of course, the slave trade was not new; the Spanish and Portuguese had introduced black slaves into America in the sixteenth century. But the need for slaves on the plantations where they produced the lucrative sugar, tobacco, rice, and cotton made the eighteenth century the high point of the Atlantic slave trade. It has been estimated that of the total 9.3 million slaves transported from Africa, almost two-thirds were taken in the eighteenth century. Between 75,000 and 90,000 Africans were transported annually, 50 percent in British ships, with the rest divided among French, Dutch, Portuguese, Danish, and American ships.

Slaving ships sailed from a European port to the African coast where Europeans had established bases where merchants could trade manufactured goods, rum, and brandy for blacks captured by African intermediaries. The captives were then closely packed into cargo ships, 300 to 450 per ship, and chained in holds without sanitary facilities or enough space to stand up; there they remained during the voyage to America, which took at least 100 days (see the box on p. 541). Mortality rates averaged 10 percent except when longer journeys due to storms or adverse winds resulted in even higher death rates.

As soon as the human cargoes arrived in the New World, they entered the plantation economy. Here the “sugar factories,” as the sugar plantations in the Caribbean were called, played an especially prominent role. By the last two decades of the eighteenth century, the British colony of Jamaica, one of Britain’s most important, was producing 50,000 tons of sugar annually with the slave labor of 200,000 blacks. The French colony of Saint Dominique (later Haiti) had 500,000 slaves working on 3,000 plantations at the same time. This colony produced...
The Atlantic Slave Trade

One of the most odious practices of early modern Western society was the Atlantic slave trade, which reached its height in the eighteenth century. Blacks were transported in densely packed cargo ships from the western coast of Africa to the Americas to work as slaves in the plantation economy. Not until late in the eighteenth century did a rising chorus of voices raise serious objections to this trade in human beings. This excerpt presents a criticism of the slave trade from an anonymous French writer.

**Diary of a Citizen**

As soon as the ships have lowered their anchors off the coast of Guinea, the price at which the captains have decided to buy the captives is announced to the Negroes who buy prisoners from various princes and sell them to Europeans. Presents are sent to the sovereign who rules over that particular part of the coast, and permission to trade is given. Immediately the slaves are brought by inhuman brokers like so many victims dragged to a sacrifice. White men who covet that portion of the human race receive them in a little house they have erected on the shore, where they have entrenched themselves with two pieces of cannon and twenty guards. As soon as the bargain is concluded, the Negro is put in chains and led aboard the vessel, where he meets his fellow sufferers. Here sinister reflections come to his mind; everything shocks and frightens him and his uncertain destiny gives rise to the greatest anxiety....

The vessel sets sail for the Antilles, and the Negroes are chained in a hold of the ship, a kind of lugubrious prison where the light of day does not penetrate, but into which the air is introduced by means of a pump. Twice a day some disgusting food is distributed to them. Their consuming sorrow and the sad state to which they are reduced would make them commit suicide if they were not deprived of all the means for an attempt upon their lives. Without any kind of clothing it would be difficult to conceal from the watchful eyes of the sailors in charge any instrument apt to alleviate their despair. The fear of a revolt, such as sometimes happens on the voyage from Guinea, is the basis of a common concern and produces as many guards as there are men in the crew. The slightest noise or a secret conversation among two Negroes is punished with utmost severity. All in all, the voyage is made in a continuous state of alarm on the part of the white men, who fear a revolt, and in a cruel state of uncertainty on the part of the Negroes, who do not know the fate awaiting them.

When the vessel arrives at a port in the Antilles, they are taken to a warehouse where they are displayed, like any merchandise, to the eyes of buyers. The plantation owner pays according to the age, strength, and health of the Negro he is buying. He has him taken to his plantation, and there he is delivered to an overseer who then and there becomes his tormentor. In order to domesticate him, the Negro is granted a few days of rest in his new place, but soon he is given a hoe and a sickle and made to join a work gang. Then he ceases to wonder about his fate; he understands that only labor is demanded of him. But he does not know yet how excessive this labor will be. As a matter of fact, his work begins at dawn and does not end before nightfall; it is interrupted for only two hours at dinnertime. The food a full-grown Negro is given each week consists of two pounds of salt beef or cod and two pots of tapioca meal. . . . A Negro of twelve or thirteen years or under is given only one pot of meal and one pound of beef or cod. In place of food some planters give their Negroes the liberty of working for themselves every Saturday; others are even less generous and grant them this liberty only on Sundays and holidays.

100,000 tons of sugar a year but at the expense of a high death rate from the brutal treatment of the slaves. It is not surprising that Saint Dominique saw the first successful slave uprising in 1793.

Despite a rising chorus of humanitarian sentiments from the philosophers, the use of black slaves remained acceptable to Western society. By and large, Europeans continued to view blacks as inferior beings fit primarily for slave labor. Not until the Society of Friends or Quakers began to criticize slavery in the 1770s and exclude from their church any member adhering to slave trafficking, did European sentiment against slavery begin to build. Even then it was not until the radical stage of the French Revolution in the 1790s that the French abolished slavery. The British followed suit in 1807. Despite the elimination of the African source, slavery continued in the newly formed United States until the Civil War of the 1860s.

**The Social Order of the Eighteenth Century**

The pattern of Europe’s social organization, first established in the Middle Ages, continued well into the eighteenth century. Social status was still largely determined not by wealth and economic standing but by the division into the traditional “orders” or “estates” determined by heredity and quality. This divinely sanctioned division of society into traditional orders was supported by Christian teaching, which emphasized the need to fulfill the responsibilities of one’s estate. Although Enlightenment intellectuals attacked these traditional distinctions, they did not die easily. In the Prussian law code of 1794, marriage between noble males and middle-class females was forbidden without a government dispensation. Even
The Peasants

Since society was still mostly rural in the eighteenth century, the peasantry constituted the largest social group, making up as much as 85 percent of Europe’s population. The conditions of peasant life differed significantly from area to area, however. The most important distinction—at least legally—was between the free peasant and the serf. Peasants in Britain, northern Italy, the Low Countries, Spain, most of France, and some areas of western Germany shared freedom despite numerous regional and local differences. Legally free peasants, however, were not exempt from burdens. Some free peasants in Andalusia in Spain, southern Italy, Sicily, and Portugal lived in a poverty more desperate than that of many serfs in Russia and eastern Germany. In France, 40 percent of free peasants owned little or no land whatever by 1789.

Small peasant proprietors or tenant farmers in western Europe were also not free from compulsory services. Most owed tithes, often one-third of their crops. Although tithes were intended for parish priests, in France only 10 percent of the priests received them. Instead the tithes wound up in the hands of towns and aristocratic landowners. Moreover, peasants could still owe a variety of dues and fees. Local aristocrats claimed hunting rights on peasant land and had monopolies over the flour mills, community ovens, and wine and oil presses needed by the peasants. Hunting rights, dues, fees, and tithes were all deeply resented.

Eastern Europe continued to be dominated by large landed estates owned by powerful lords and worked by serfs. Serfdom had come late to the east, having largely been imposed in the sixteenth and seventeenth centuries. Peasants in eastern Germany were bound to the lord’s estate, had to perform labor services on the lord’s land, and could not marry or move without permission and payment of a tax. By the eighteenth century, landlords also possessed legal jurisdiction, giving them control over the administration of justice. Only in the Habsburg empire had a ruler attempted to improve the lot of the peasants through a series of reforms. With the exception of the clergy and a small merchant class, eighteenth-century Russia, unlike the rest of Europe, was still largely a society of landlords and serfs. Russian peasants were not attached to the land but to the landlord and thus existed in a condition approaching slavery. In 1762, landowners were given the right to transfer their serfs from one estate to another.

The local villages in which they dwelt remained the centers of peasants’ social lives. Villages, especially in western Europe, maintained public order; provided poor relief, a village church, and sometimes a schoolmaster; collected taxes for the central government; maintained roads and bridges; and established common procedures for sowing, plowing, and harvesting crops. But villages were often dominated by richer peasants and proved highly resistant to innovations, such as new crops and agricultural practices.

The diet of the peasants in the eighteenth century did not vary much from that of the Middle Ages. Dark bread, made of roughly ground wheat and rye flour, remained the basic staple. It was quite nourishing and high in vitamins, minerals, and even proteins since the bran and germ were not ground out. Peasants drank water, wine, and beer and ate soups and gruel made of grains and vegetables. Especially popular were peas and beans, eaten fresh in summer but dried and used in soups and stews in winter. The new foods of the eighteenth century, potatoes and American corn, added important elements to the peasant diet. Of course, when harvests were bad, hunger and famine became the peasants’ lot in life, making them even more susceptible to the ravages of disease.

The Nobility

The nobles, who constituted about 2 or 3 percent of the European population, played a dominating role in society. Being born a noble automatically guaranteed a place at the top of the social order with all of its attendant special privileges and rights. The legal privileges of the nobility included judgment by their peers, immunity from severe punishment, exemption from many forms of taxation, and rights of jurisdiction. Especially in central and eastern Europe, the rights of landlords over their serfs were overwhelming. In Poland until 1768, the nobility even possessed the right of life or death over their serfs.

In many countries, nobles were self-conscious about their unique style of life that set them apart from the rest of society. This did not mean, however, that they were unwilling to bend the conventions of that lifestyle if there were profits to be made. For example, by convention nobles were expected to live off the yields of their estates. But although nobles almost everywhere talked about trade as being beneath their dignity, many were not averse to mercantile endeavors. Many were also only too eager to profit from industries based on the exploitation of raw materials found on their estates; as a result, many nobles were involved in mining, metallurgy, and glassmaking.
Their diet also set them off from the rest of society. Aristocrats consumed enormous quantities of meat and fish dishes accompanied by cheeses, nuts, and a variety of sweets.

Nobles also played important roles in military and government affairs. Since medieval times, landed aristocrats had functioned as military officers. Although monarchs found it impossible to exclude commoners from the ranks of officers, tradition maintained that nobles made the most natural and hence the best officers. Moreover, the eighteenth-century nobility played a significant role in the administrative machinery of state. In some countries, such as Prussia, the entire bureaucracy reflected aristocratic values. Moreover, in most of Europe, the landholding nobility controlled much of the local government in their districts.

The nobility or landowning class was not a homogeneous social group. Landlords in England leased their land to tenant farmers while those in eastern Europe used the labor services of serfs. Nobles in Russia and Prussia served the state, but those in Spain and Italy had few official functions. Differences in wealth, education, and political power also led to differences within countries as well. In France, where there were about 350,000 nobles, only 4,000 noble families had access to the court. The gap between rich and poor nobles could be enormous. According to figures for the poll tax in France, the richest nobles were assessed 2,000 livres a year while some nobles, because of their depressed economic state, paid only 6. Both groups were legally nobles. As the century progressed, poor nobles sometimes sank into the ranks of the unprivileged masses of the population. It has been estimated that the number of European nobles declined by one-third between 1750 and 1815.

Although the nobles clung to their privileged status and struggled to keep others out, almost everywhere a person with money found it possible to enter the ranks of the nobility. Rights of nobility were frequently attached to certain lands, so purchasing the lands made one a noble; the acquisition of government offices also often conferred noble status.

**THE ARISTOCRATIC WAY OF LIFE: THE COUNTRY HOUSE**

One aristocrat who survived the French Revolution once commented that "no one who did not live before the Revolution" could know the real sweetness of living. Of course, he spoke not for the peasants whose labor maintained the system, but for the landed aristocrats. For them the eighteenth century was a final century of "sweetness" before the Industrial Revolution and bourgeois society diminished their privileged way of life.

In so many ways, the court of Louis XIV had provided a model for other European monarchs who built palaces and encouraged the development of a court society as a center of culture. As at Versailles, these courts were peopled by members of the aristocracy whose income from rents or officeholding enabled them to participate in this lifestyle. This court society, whether in France, Spain, or Germany, manifested common characteristics: participation in intrigues for the king’s or prince’s favor, serene walks in formal gardens, and duels to maintain one’s honor.

The majority of aristocratic landowners, however, remained on their country estates and did not participate in court society; their large houses continued to give witness to their domination of the surrounding countryside. This was especially true in England where the court of the Hanoverian kings (Georges I–III from 1714 to 1820) made little impact on the behavior of upper-class society. English landed aristocrats invested much time, energy, and money in their rural estates, giving the English country house an important role in English social life. One American observer remarked: "Scarcely any persons who hold a leading place in the circles of their society live in London. They have houses in London, in which they stay while Parliament sits, and occasionally visit at other seasons; but their homes are in the country."

After the seventeenth century, the English referred to their country houses, regardless of size, not as chateaus or villas but merely houses. Although there was much variety in country houses, many in the eighteenth century were built in the Georgian style named after the Hanoverian kings. This style was greatly influenced by the classical serenity and sedateness of the sixteenth-century Venetian architect Andrea Palladio, who had specialized in the design of country villas. The Georgian country house combined elegance with domesticity, and its interior was often characterized as possessing a comfort of home that combined visual delight and usefulness.

The country house also fulfilled a new desire for greater privacy that was reflected in the growing separation between the lower and upper floors. The lower floors were devoted to public activities—dining, entertaining, and leisure. A central entrance hall provided the setting for the ceremonial arrival and departure of guests on formal occasions. From the hall, guests could proceed to a series of downstairs common rooms. The largest was the drawing room (larger houses possessed two), which contained musical instruments and was used for dances or card games, a favorite pastime. Other common rooms included a formal dining room, informal breakfast room, library, study, gallery, billiard room, and conservatory. The entrance hall also featured a large staircase that led to the upstairs rooms, which consisted of bedrooms for husbands and wives, sons, and daughters. These rooms were used not only for sleeping but also for private activities, such as playing for the children and sewing, writing, and reading for wives. This arrangement reflected the new desire for privacy. "Going upstairs" literally meant leaving the company of others in the downstairs common rooms to be alone in the privacy of one’s bedroom. This eighteenth-century desire for privacy also meant keeping servants at a distance. They were now
housed in their own wing of rooms and alerted to their employers’ desire for assistance by a new invention—long-distance cords connected to bells in the servants’ quarters.

Although the arrangement of the eighteenth-century Georgian house originally reflected male interests, the influence of women was increasingly evident by the second half of the eighteenth century. Already in the seventeenth century, it had become customary for the sexes to separate after dinner; while the men preoccupied themselves with brandy and cigars in the dining room, women would exit to a “withdrawing room” for their own conversation. In the course of the eighteenth century, the drawing room became a larger, more feminine room with comfortable furniture grouped casually in front of fireplaces to create a cozy atmosphere.

Aristocratic landowners, especially in Britain, also sought to expand the open space around their country houses to separate themselves from the lower classes in the villages and to remove farmland from their view. Often these open spaces were then enclosed by walls to create parks (as they were called in England) to provide even more privacy. Sometimes entire villages were destroyed to create a park, causing one English poet to lament the social cost:

The man of wealth and pride
Takes up the space that many poor supplied;
Space for his lake, his park’s extended bounds,
Space for his horses, equipage and hounds.¹⁰

Along with a sense of privacy, parks gave landed aristocrats the ability to reshape their property to meet their leisure needs.

THE ARISTOCRATIC WAY OF LIFE: THE GRAND TOUR

One characteristic of the high culture of the Enlightenment was its cosmopolitanism, reinforced by education in the Latin classics and the use of French as an international language. Travel was another manifestation of the Enlightenment’s cosmopolitanism and interest in new vistas. One important aspect of eighteenth-century travel was the Grand Tour in which the sons of aristocrats completed their educations by making a tour of Europe’s major cities. The English aristocracy in particular regarded the Grand Tour as crucial to their education. The great-aunt of Thomas Coke wrote to him upon his completion of school: “Sir, I understand you have left Eton and probably intend to go to one of those Schools of Vice, the Universities. If, however, you choose to travel I will give you 500 pounds [about $12,500] per annum.”¹¹ Coke was no fool and went on the Grand Tour, along with many others. In one peak year alone, 40,000 Englishmen were traveling in Europe.

Travel was not easy in the eighteenth century. Crossing the English Channel could be difficult in rough seas and might take anywhere from three to twelve hours. The trip from France to Italy could be made by sea, where the traveler faced the danger of pirates, or overland by sedan chair
over the Alps, where narrow passes made travel an adventure in terror. Inns, especially in Germany, were populated by thieves and the ubiquitous bed bugs. The English in particular were known for spending vast sums of money during their travels; as one observer recounted: “The French usually travel to save money, so that they sometimes leave the places where they sojourn worse off than they found them. The English, on the other hand, come over with plenty of cash, plenty of gear, and servants to wait on them. They throw their money about like lords.”

Since the trip’s purpose was educational, young Englishmen in particular were usually accompanied by a tutor who ensured that his charges spent time looking at museum collections of natural history and antiquities. But tutors were not able to stop young men from also pursuing wine, women, and song. After crossing the Channel, English visitors went to Paris for a cram course on how to act sophisticated. They then went on to Italy, where their favorite destinations were Florence, Venice, and Rome. In Florence, the studious and ambitious studied art in the Uffizi Gallery. The less ambitious followed a less vigorous routine; according to the poet Thomas Gray, they “get up at twelve o’clock, breakfast till three, dine till five, sleep till six, drinking cooling liquors till eight, go to the bridge till ten, sup till two, and so sleep till twelve again.” In Venice, where sophisticated prostitutes had flourished since Renaissance times, the chief attraction for young English males was women. As Samuel Johnson remarked: “If a young man is wild, and must run after women and bad company, it is better this should be done abroad.” Rome was another “great object of our pilgrimage,” where travelers visited the “modern” sights, such as Saint Peter’s and, above all, the ancient ruins. To a generation raised on a classical education, souvenirs of ruins and Piranesi’s etchings of classical ruins were required purchases. The accidental rediscovery of the ancient Roman towns of Herculaneum and Pompeii made them a popular eighteenth-century tourist attraction.

The Inhabitants of Towns and Cities

The social importance of towns differed significantly between eastern and western Europe. In eastern Europe, cities were generally smaller and had little real autonomy. In western Europe, they were larger and frequently were accustomed to municipal self-government and municipal privileges.

Except in the Dutch Republic, Britain, and parts of Italy, townspeople were still a distinct minority of the total population. At the end of the eighteenth century, about one-sixth of the French population lived in towns of 2,000 or more. The biggest city in Europe was London with its 1 million inhabitants while Paris numbered between 550,000 and 600,000. Altogether, Europe had at least twenty cities in twelve countries with populations over 100,000, including Naples, Lisbon, Moscow, St. Petersburg, Vienna, Amsterdam, Berlin, Rome, and Madrid.

Although urban dwellers were vastly outnumbered by rural inhabitants, towns played an important role in Western culture. The contrasts between a large city with its education, culture, and material consumption and the surrounding, often poverty-stricken countryside were striking, evident in this British traveler’s account of Russia’s St. Petersburg in 1741:

The country about Petersburg has full as wild and desert a look as any in the Indies; you need not go above 200 paces out of the town to find yourself in a wild wood of firs, and
Poverty in France

Unlike the British, who had a system of public-supported poor relief, the French responded to poverty with ad hoc policies when conditions became acute. This selection is taken from an intendant’s report to the controller-general at Paris describing his suggestions for a program to relieve the grain shortages expected for the winter months.

M. de la Bourdonnaye, Intendant of Bordeaux, to the Controller-General, September 30, 1708

Having searched for the means of helping the people of Agen in this cruel situation and having conferred with His Eminence, the Bishop, it seems to us that three things are absolutely necessary if the people are not to starve during the winter.

Most of the inhabitants do not have seed to plant their fields. However, we decided that we would be going too far if we furnished it, because those who have seed would also apply [for more]. Moreover, we are persuaded that all the inhabitants will make strenuous efforts to find some seed, since they have every reason to expect prices to remain high next year.

But this project will come to nothing if the collectors of the taille continue to be as strict in the exercise of their functions as they have been of late and continue to employ troops [to force collection]. Those inhabitants who have seed grain would sell it to be freed from an oppressive garrison, while those who must buy seed, since they have none left from their harvest and have scraped together a little money for this purchase, would prefer to give up that money [for taxes] when put under police constraint. To avoid this, I feel it is absolutely necessary that you order the receivers-general to reduce their operations during this winter, at least with respect to the poor.

We are planning to import wheat for this region from Languedoc and Quercy, and we are confident that there will be enough. But there are two things to be feared: one is the greed of the merchants. When they see that general misery has put them in control of prices, they will raise them to the point where the calamity is almost as great as if there were no provisions at all. The other fear is that the artisans and the lowest classes, when they find themselves at the mercy of the merchants, will cause disorders and riots. As a protective measure, it would seem wise to establish two small storehouses. . . . Ten thousand ecus [30,000 livres] would be sufficient for each . . . . A third point demanding our attention is the support of beggars among the poor, as well as of those who have no other resources than their wages. Since there will be very little work, these people will soon be reduced to starvation. We should establish public workshops to provide work as was done in 1693 and 1694. I should choose the most useful kind of work, located where there are the greatest number of poor. In this manner, we should rid ourselves of those who do not want to work and assure the others a moderate subsistence. For these workshops, we would need about 40,000 livres, or altogether 100,000 livres. The receiver-general of the taille of Agen could advance this sum. The 60,000 livres for the storehouses he would get back very soon. I shall await your orders on all of the above.

Marginal Comments by the Controller-General

Operations for the collection of the taille are to be suspended. The two storehouses are to be established; great care must be taken to put them to good use. The interest on the advances will be paid by the king. His Majesty has agreed to the establishment of the public workshops for the able-bodied poor and is willing to spend up to 40,000 livres on them this winter.

such a low, marshy, boggy country that you would think God when he created the rest of the world for the use of mankind had created this for an inaccessible retreat for all sorts of wild beasts.¹³

Peasants often resented the prosperity of towns and their exploitation of the countryside to serve urban interests. Palermo in Sicily used one-third of the island’s food production while paying only one-tenth of the taxes. Towns lived off the countryside not by buying peasant produce, but by acquiring it through tithes, rents, and dues.

Many cities in western and even central Europe had a long tradition of patrician oligarchies that continued to control their communities by dominating town and city councils. Despite their domination, patricians constituted only a small minority of the urban population. Just below the patricians stood an upper crust of the middle classes: nonnoble officeholders, financiers and bankers, merchants, wealthy rentiers who lived off their investments, and important professionals, including lawyers. Another large urban group was the petty bourgeoisie or lower middle class made up of master artisans, shopkeepers, and small traders. Below them were the laborers or working classes. Much urban industry was still carried on in small guild workshops by masters, journeymen, and apprentices. Apprentices who acquired the proper skills became journeymen before entering the ranks of the masters, but increasingly in the eighteenth century, guilds became closed oligarchies as membership was restricted to the relatives of masters. Many skilled artisans were then often forced to become low-paid workers. Urban communities also had a large group of unskilled workers who served as servants, maids, and cooks...
at pitifully low wages. One study of a pre-industrial French city found that two married workers with one child received a family income of 380 livres; basic necessities for the family cost 336 livres, leaving very little for extra expenses.

Despite an end to the ravages of plague, eighteenth-century cities still experienced high death rates, especially among children, because of unsanitary living conditions, polluted water, and a lack of sewerage facilities. One observer compared the stench of Hamburg to an open sewer that could be smelled for miles around. Overcrowding also exacerbated urban problems as cities continued to grow from an influx of rural immigrants. But cities proved no paradise for them as unskilled workers found few employment opportunities. The result was a serious problem of poverty in the eighteenth century.

**THE PROBLEM OF POVERTY**

Poverty was a highly visible problem in the eighteenth century both in cities and in the countryside (see the box on p. 546). In Venice licensed beggars made up 3 to 5 percent of the population, and unlicensed beggars may have constituted as much as 13 to 15 percent. Beggars in Bologna, Italy, were estimated at 25 percent of the population; in Mainz figures indicate that 30 percent of the people were beggars or prostitutes. Prostitution was often an alternative to begging. In France and Britain by the end of the century, an estimated 10 percent of the people depended on charity or begging for their food.

Earlier in Europe the poor had been viewed as blessed children of God; assisting them was a Christian duty. A change of attitude that had begun in the latter part of the sixteenth century became even more apparent in the eighteenth century. Charity to poor beggars, it was argued, simply encouraged their idleness and led them to vice and crime. A French official stated: “Beggary is the apprenticeship of crime; it begins by creating a love of idleness which will always be the greatest political and moral evil. In this state the beggar does not long resist the temptation to steal.” Although private charitable institutions such as the religious Order of Saint Vincent de Paul and the Sisters of Charity had been founded to help such people, they were soon overwhelmed by the increased numbers of indigent in the eighteenth century.

Although some “enlightened” officials argued that the state should become involved in the problem, mixed feelings prevented concerted action. Since the sixteenth century, vagrancy and begging had been considered crimes. In the eighteenth century, French authorities attempted to round up vagrants and beggars and incarcerate them for eighteen months to act as a deterrent. This effort accomplished little, however, since the basic problem was socioeconomic. These people had no work. In the 1770s, the French tried to use public works projects, such as road building, to give people jobs, but not enough funds were available to accomplish much. The problem of poverty remained as another serious blemish on the quality of eighteenth-century life.

---

**CONCLUSION**

Everywhere in Europe at the beginning of the eighteenth century, the old order remained strong. Nobles, clerics, towns, provinces all had privileges, some medieval in origin, others the result of the attempt of monarchies in the sixteenth and seventeenth centuries to gain financial support from their subjects. Everywhere in the eighteenth century, monarchs sought to enlarge their bureaucracies to raise taxes to support the new large standing armies that had originated in the seventeenth century. The existence of these armies made wars more likely. The existence of five great powers, with two of them (France and Britain) in conflict in the East and the New World, initiated a new scale of conflict; the Seven Years’ War could legitimately be viewed as the first world war. The wars altered some boundaries on the European continent, but were...
Perhaps most significant for the British victories that marked the emergence of Great Britain as the world’s greatest naval and colonial power. Everywhere in Europe, increased demands for taxes to support these conflicts led to attacks on the privileged orders and a desire for change not met by the ruling monarchs.

At the same time, sustained population growth, dramatic changes in finance, trade, and industry, and the growth of poverty created tensions that undermined the traditional foundations of European society. The inability of the old order to deal meaningfully with these changes led to a revolutionary outburst at the end of the eighteenth century that brought the beginning of the end for that old order.
